

BTG SPORTS GROUP • SPONSORX

SponsorX NEXT

Integration Specification

How the student-run high-school sports media programme joins the existing SponsorX platform — what already exists, what does not, and in what order it should be built.

Task P0-PM0-14 • Version 1.0 • 2026-09-22 • Status: proposed

SponsorX NEXT is a student-run high-school sports media programme: each participating school fields a student media team that writes, shoots, designs and **sells** a quarterly magazine, and SponsorX supplies the platform, templates, training, sales structure and sponsor relationships.

This document answers one question — *does NEXT go into the product, or beside it?* — and then specifies the integration. It is a proposal, not a decision; §12 lists what it deliberately leaves open.

Source of record: `documentation/SponsorX-NEXT-Integration-Spec.md`

This document is generated from it — edit the Markdown, not this file.

Contents

1 • The verdict, in three lines

2 • Why not a separate application

3 • What already exists

4 • The finding that decides the shape

5 • The four gaps

5.1 • **Student** — not an **Athlete**

5.2 • **Publication** / **Edition** / **AdSlot** — finite, positional, deadlined

5.3 • **RevenueSplit** — and **Earning** left alone

5.4 • **StudentPoints** — and why it is not money

6 • Attribution — a third namespace, not a fourth use of **TrackingLink**

7 • Roles

8 • Routes

9 • Front-end design impact

What does not change

9.1 • A fifth portal accent — and no logo colour left

9.2 • Four nav glyphs

9.3 • Three screen archetypes the app has never rendered

9.4 • Mobile-first, for the first time

9.5 • Two new public audiences

9.6 • Not the design system

9.7 • Deferred — the digital edition reader

10 • Sequencing — Stage 0 runs on what exists

11 • Roadmap slot

12 • What this does not decide

1 · The verdict, in three lines

1. **NEXT integrates.** Roughly 70% of it already exists in the Phase 1 models under different nouns.
2. **It is not a second application, and not a second tenant.** It is a module inside the BTG tenant.
3. **It should not be built yet.** The first edition runs on primitives that already exist (\$10). The four new models are earned by an edition that has actually sold, not by this document.

2 · Why not a separate application

The source document's own thesis is that the magazine is *"the front door into your entire media and sponsorship ecosystem"* — an acquisition funnel whose QR codes land on SponsorX athlete profiles. Separating it breaks precisely that:

- **The funnel would cross a trust boundary.** The QR lives in NEXT; the athlete profile it points at lives in SponsorX. Cross-tenant reads are what the \$09 authorization matrix and the tenant-isolation tests exist to forbid.
- **The same local business becomes two customer records.** A pizzeria that buys a full-page ad and a 10-Athlete Blitz would be two **Sponsor** rows and two Zoho Account sync paths — the duplicate that \$18's external-ID rule exists to prevent.
- **Everything downstream doubles.** Two content-approval pipelines, two QR funnels, two reporting stacks, two RBAC matrices, two Zoho boundaries.

A separate tenant fails for the same reasons in the same places. NEXT is a module in the BTG tenant, sharing **Sponsor**, **Property**, **Athlete**, the reward funnel and the Zoho boundary.

3 · What already exists

SponsorX NEXT concept	Existing primitive	Work
Participating school	Property where <code>kind = "SCHOOL"</code>	none
Local business buying an ad	Sponsor (+ Zoho Account, bi-directional)	none
The ad sale	CampaignBrief → Campaign → CampaignOrder	none
Article / photo / design assignment	Deliverable + CreativeAsset	rename only
Editorial review workflow	DeliverableState	none — see below
"SCAN TO MEET THE ATHLETE"	Reward + RewardToken + <code>/r/[token]</code> → <code>/public/athletes/[slug]</code>	none
Parent / guardian consent for a minor	Guardian + AgreementAcceptance.guardianId	none

SponsorX NEXT concept	Existing primitive	Work
Sponsor campaign report	ROI report + MetricSource provenance labels	one label
Programme-wide analytics	MetricDaily , LinkEvent , RewardEvent	none

Two of these deserve a sentence each.

DeliverableState is already an editorial workflow. **NOT_STARTED** → **DRAFT_SUBMITTED** → **BTG_REVIEW** → **SPONSOR_REVIEW** → **APPROVED** → **PUBLISHED** → **VERIFIED** is what a student article does on its way to print: drafted, read by the advisor, seen by the sponsor where the sponsor paid for a feature, approved, printed, confirmed. It was designed for campaign deliverables and it fits unchanged. The **approvals-desk** screen becomes the editorial desk without a new state machine.

Print circulation is **ESTIMATED**. 500 copies × an assumed pass-along is not a measured impression, and the provenance taxonomy (**P0-DATA-01**) already has the label for exactly that. Circulation enters as **MetricSource.ESTIMATED** and the sponsor report is honest about it without any new machinery.

4 · The finding that decides the shape

SponsorPackage needs no schema change to sell a NEXT package.

The model already carries two JSON fields with settled meanings:

- **lineItems** — job codes and counts, the NIL work (`{ "jobCode": "SX-02", "quantityPerAthlete": 1 }`)
- **includes** — "Non-NIL inventory sold alongside the jobs, e.g. an iMC/BTG feature"

A magazine page is non-NIL inventory sold alongside the jobs. It belongs in **includes**, which **P0-PM0-13** \$5 already established must be *a record with a line*, not an unpriced phrase in a description.

So the source document's flagship product — the **\$1,500 Local Business Package**: full-page ad + 4 student-created social posts + sponsored athlete feature + QR promotion + campaign report — is an ordinary **SponsorPackage**:

```
{
  "code": "NEXT-LOCAL-1500",
  "lineItems": [ { "jobCode": "SX-02", "quantityPerAthlete": 4 } ],
  "includes": [
    { "kind": "AD_SLOT", "slotCode": "FULL_PAGE", "quantity": 1 },
    { "kind": "FEATURE", "featureCode": "ATHLETE_SPOTLIGHT" }
  ]
}
```

It then flows, untouched, through the sponsor marketplace, the campaign builder, the **1.4×** margin floor (**P3-BE-12**), the Zoho Deal sync and the ROI report. **This is the integration.** Everything in \$5 exists only to make that **includes** entry mean something.

Two consequences, and the second is a constraint nobody has had to think about yet:

- **includes** is free JSON today, so nothing stops the back cover being sold twice. That scarcity constraint is what **AdSlot** (\$5.2) is for.
- A pure ad sale has no **CampaignOrder** at all. **CampaignOrder.athleteId** and **.jobId** are both non-null — an order is an athlete doing a job. A business buying only a quarter page involves no athlete, so that campaign carries zero order rows. The hybrid package in the block above is fine: its four SX-02 posts are ordinary orders and the ad slot rides alongside them. The pure ad is the case to settle (\$5.2).

5 · The four gaps

Everything not listed here is reuse. These four are genuinely absent.

5.1 · Student — not an Athlete

An athlete correspondent is both, so **Student** carries an optional link rather than extending **Athlete**. Three reasons they cannot be one model:

- **Different attributes.** A student has a masthead role (Editor, Writer, Photographer, Sales) and a school. They have no sport, position, tier or rate card, and a nullable half of **Athlete** for every student is a model that lies.
- **Different compensation semantics.** Athlete compensation is money with a **taxYear** rollup. Student compensation is deliberately *not* cash — the source document is explicit about school programme funds, scholarships, stipends and documented paid roles "rather than informal cash payments."
- **Different consent posture.** Nearly every student is a minor. **Guardian** and **AgreementAcceptance.guardianId** already handle this and are reused as-is.

```
model Student {
  id          String    @id @default(cuid())
  tenantId    String
  propertyId  String      // the school
  athleteId   String?    @unique    // an athlete correspondent is both
  guardianId  String?
  legalName   String
  displayName String
  email       String
  gradYear    Int?
  /// EDITOR | WRITER | PHOTOGRAPHER | VIDEO | DESIGNER | SALES | CORRESPONDENT
  masthead    String[]
  state       StudentState @default(DRAFT) // mirrors AthleteState
  createdAt   DateTime @default(now())
}
```

StudentState mirrors **AthleteState** rather than inventing a vocabulary: a student application is reviewed by an advisor exactly as an athlete application is reviewed by a network manager.

5.2 · Publication / Edition / AdSlot — finite, positional, deadlined

This is the one thing the commercial catalogue cannot model. A **NilJob** is athlete-time, priced per athlete, available until the athlete is busy. A back cover is **quantity one**, on **one edition**, unsellable after the **close date**. Scarcity, position and a deadline are three properties **NilJob** has no column for, and forcing them in would corrupt the **sellFloor*** derivation that **P0-PM0-13** settled.

- **Publication** — the masthead per school or region. *SponsorX NEXT: DeMatha Edition, SponsorX NEXT — DMV Edition*. Belongs to a **Property**, or to none for a regional edition.
- **Edition** — Fall / Winter / Spring / Year-End, carrying **closeDate** (the ad deadline), **printDate**, **pageCount**, and a state machine: **PLANNING** → **SELLING** → **CLOSED** → **IN_PRODUCTION** → **PRINTED** → **DISTRIBUTED**.
- **AdSlot** — the inventory ledger. One row per sellable position per edition, with **slotCode** (**BUSINESS_CARD**, **QUARTER**, **HALF**, **FULL_PAGE**, **INSIDE_COVER**, **BACK_COVER**, **TEAM_SPONSOR**, ...), a price in **integer cents**, a quantity, and a nullable **campaignId** once sold. It points at the **Campaign**, not at a **CampaignOrder**, for the reason in §4: an order requires an athlete and a job, and an ad slot has neither. This is what makes the **includes** entry in §4 enforceable.

Rate card from the source document, for seeding:

Slot	Price	Quantity per edition
Business Card	\$150	many
Quarter Page	\$250	many
Half Page	\$400	many
Full Page	\$650	many
Inside Cover	\$1,000	2
Back Cover	\$1,500	1
Team Sponsor	\$1,000	per team
Athlete Spotlight Sponsor	\$750	per feature
Season Sponsor	\$2,500	few
Presenting Sponsor	\$5,000+	1
Senior Congratulations	\$100–\$250	many

Two rules need checking against this, neither of them a NEXT problem so much as a case the Phase 1 models were never posed:

- **The 1.4× margin floor.** **P0-PM0-13** §2 applies it *per campaign-order line*, so a pure ad sale is correct by construction — no order line, nothing to evaluate — and a hybrid package's NIL lines are checked exactly as they are today. The one thing to confirm with **P3-BE-12**'s author: if the check ever compares a **package price** against summed athlete cost rather than going line by line, a hybrid package's ad revenue would inflate the apparent margin and hide a losing NIL line behind a profitable page.

- The **Campaign** state machine. **DRAFT** → **STAFFING** → **APPROVAL** → **ACTIVE** → **REPORTING** → **COMPLETED** assumes athletes to staff. A pure ad campaign has none and would sit in **STAFFING** with nothing to do. Either ad-only campaigns skip to **APPROVAL**, or an ad sale is not a **Campaign** at all and attaches to the **Edition** directly. **Unresolved — \$12**.

5.3 · **RevenueSplit** — and **Earning** left alone

The source document splits net revenue four ways: SponsorX 35% / school 25% / student pool 25% / editorial fund 15%.

Earning cannot express this and should not be made to. It is one order → one athlete → one gross, indexed [**athleteId**, **taxYear**] for year-end reporting, and the payment policy gate has already fixed its meaning. Making it polymorphic would put schools, internal funds and minors' scholarship pools into the table finance reconciles athlete payouts from.

So: a separate **RevenueSplit**, attached to the **Edition**, with a **payeeKind** (**SPONSORX** | **SCHOOL** | **STUDENT_POOL** | **EDITORIAL_FUND**), a basis-points share, a computed amount in cents, and its own state. **Earning** stays exactly what it is and continues to mean athlete NIL compensation. Where a NEXT campaign includes real NIL work, that athlete's compensation is an ordinary **Earning** as always — the split applies to what is left after costs, not to the athlete line.

5.4 · **StudentPoints** — and why it is not money

Points: 50 an article, 25 an interview, 25 a business appointment, 100 per \$500 sold. They unlock merchandise, equipment, internships, credentials and scholarship consideration.

A points ledger is a separate model with **no EarningState**, **no taxYear**, **no cents column**, and **no relation to Earning**. The separation is not tidiness. If points and cents share a table, a finance reconciliation of athlete payouts starts returning minors' scholarship balances, and the thing the source document is carefully avoiding — informal money to minors — arrives through the database instead of through a decision.

6 · **Attribution** — a third namespace, not a fourth use of **TrackingLink**

A student sales code (**JORDAN25**) is a third attribution subject. The schema already carries a scar from collapsing the first two:

A tracking link measures AN ATHLETE'S DELIVERABLE. A reward token measures A FAN'S JOURNEY. V1 collapsed them and wrote a TrackingLink id into a field that foreign-keys RewardToken; that bug is the reason these are separate.

A student's sale is neither. **TrackingLink.deliverableId** is **@unique** and non-null by design, and a sales code belongs to a person across many sales. Relaxing it to fit would repeat the exact mistake the comment is a monument to.

StudentCode + **SaleAttribution** are their own models with the same *shape* — opaque code, event rows, never a counter — resolved at **/s/[code]**. Three short routes (**/t/**, **/r/**, **/s/**) with three clear subjects beats one that has to ask what it is looking at.

7 · Roles

Two additions to the `Role` enum:

Role	Scope
<code>STUDENT</code>	Own masthead assignments, own sales and codes, own points. Never another student's sales, never any athlete rate.
<code>ADVISOR</code>	The faculty advisor. One school. Reviews student applications and approves student content before it reaches BTG review.

`PROPERTY_MGR` is deliberately **not** reused for the advisor. It scopes to a property's inventory and analytics; an advisor's permissions are editorial and custodial over minors, which is a different set that happens to share a row scope. Two roles with clear permissions beat one role with a comment.

Both additions need the `authz-policy.ts` matrix extended and the tenant-isolation tests grown — the guardrail already names field-level authz as the real risk, and `AthleteRate.amount` must be invisible to a `STUDENT` as firmly as it is to a sponsor.

8 · Routes

Following the existing structure, no new patterns:

Route	Purpose
<code>(public)/next</code>	Programme landing — the two audiences in §9
<code>(public)/next/apply</code>	"Become the Media" — student application
<code>(public)/next/schools</code>	School adoption — administrator-facing
<code>(public)/next/[school]/[edition]</code>	Digital edition (deferred — §9.7)
<code>(app)/next</code>	Student portal — assignments, sales, codes, points
<code>(app)/advisor</code>	Advisor desk — applications, student content review
<code>(app)/admin/next/editions</code>	Edition planning and the page map
<code>(app)/admin/next/inventory</code>	Ad slot ledger, sold/reserved/open
<code>(app)/admin/next/production</code>	Editorial board (reuses <code>approvals-desk</code>)
<code>(app)/admin/next/splits</code>	Revenue splits per edition
<code>/s/[code]</code>	Student sales code resolver

`/(public)/athletes/[slug]` already serves as the "SCAN TO MEET THE ATHLETE" destination and needs nothing.

9 · Front-end design impact

Less than the feature list suggests, because the portal chrome is already parameterised. But it is not zero, and two of the items are real design work.

What does not change

`app/globals.css` — the A0 brand palette, the type scale, the surface steps and the A2 light variant are untouched. `PortalShell` is keyed by a `Portal` union (`"sponsor"` | `"athlete"` | `"admin"` | `"property"`) into an `ACCENT` map that resolves `text` / `bg` / `dot` / `wash` / `edge` / `label`, and hands the rest to `PortalNav`. A fifth portal is **one union member and one `ACCENT` entry** — the bloom, the hairlines, the watermark and the staggered entrance all follow from it. That is the design system doing its job. Reused wholesale: `approvals-desk`, `join-wizard`, `filter-kit`, `charts`, `progress-ring`, `count-up`, `athlete-profile-view`, `export-report`, `pagination`, `back-link`.

9.1 · A fifth portal accent — and no logo colour left

The four accents are all derived from the logo per A0: athlete blue `#2E9BF5`, sponsor orange `#F97A1F`, admin steel `#CBD5E1`, property soft-blue `#63B4F8`. NEXT needs a fifth and the logo has no more colours in it. Two options:

- reuse `--sx-accent` orange, treating NEXT as a sponsor-revenue surface — free, but the sponsor and NEXT portals stop being distinguishable at a glance
- introduce one new token, which then owes a light-theme value and the `P1-QA-02` contrast pass in **both** themes

Recommend the second. It is a brand decision, not a code one, and belongs to whoever owns the logo.

9.2 · Four nav glyphs

`ICONS` has no book, pen, camera or trophy. Same 24×24 `viewBox`, 1.6 stroke, round caps and joins.

9.3 · Three screen archetypes the app has never rendered

- **Edition page map.** Finite positional inventory — a page grid showing sold / reserved / open, the back cover as a singleton, a close date counting down. `marketplace-catalog` lists packages; nothing in the app renders scarcity against a layout. This is the one genuinely new interaction.
- **Leaderboard.** Ranked, cross-school, with movement and prize tiers. `charts` and `count-up` get part of the way; the archetype is new.
- **Points balance and reward catalogue.** Must be visually *unlike* `athlete/earnings` — deliberately. Points are not money, and a student or a parent who reads a points balance as a dollar balance is a legal problem before it is a UX one. Different card, different treatment, no currency glyph anywhere on the screen.

9.4 · Mobile-first, for the first time

Every existing portal is a desk: admin approvals, finance workspace, campaign builder, matching studio. The student portal is the opposite — a sixteen-year-old selling an ad in a parking lot on a phone. **mobile-nav** exists, but the student routes should be designed at 390px and widened, which is the reverse of how the rest of the app was built.

9.5 · Two new public audiences

(**public**) currently speaks to athletes and sponsors. NEXT adds teenagers ("Become the Media") and school administrators (programme adoption) — different voice, different proof, different CTA, and an administrator page that has to survive being forwarded to a principal. **Most of the actual design hours in this programme sit here**, not in the portals.

9.6 · Not the design system

Magazine page layout is InDesign or Canva, and the printer's problem. The platform's only interest is the approved artwork as a **CreativeAsset** and the final press PDF. Building page layout in Tailwind would be the scope error that sinks the programme.

9.7 · Deferred — the digital edition reader

Long-form editorial typography — measure, drop caps, pull quotes, photo galleries — is a reading experience this dashboard product has no type scale for. The pilot ships article pages on the existing scale, or a third-party flipbook. The reader is Stage 2 at the earliest.

10 · Sequencing — Stage 0 runs on what exists

The roadmap has the \$39 protected loop not yet closed end to end. NEXT is a second unproven loop, and \$37's own gate — *"Before Phase 2: Phase 1 campaigns operating reliably"* — applies to it in spirit.

So the **first edition ships with zero new models**:

NEXT need	Stage 0 mechanism
School	<code>Property kind = "SCHOOL"</code>
Ad and hybrid packages	<code>SponsorPackage</code> , print slots in <code>includes</code>
Local business	<code>Sponsor</code> (+ Zoho Account)
The sale	<code>CampaignBrief</code> → <code>Campaign</code> → <code>CampaignOrder</code>
Artwork approval	<code>Deliverable</code> + <code>CreativeAsset</code>
Athlete QR	<code>Reward / RewardToken</code> → <code>/r/[token]</code> → <code>/athletes/[slug]</code>
Student sales code	<code>TrackingLink</code> on the campaign deliverable (<i>approximate</i>)
Back-cover scarcity	a person, watching

NEXT need	Stage 0 mechanism
Splits and points	spreadsheet

What Stage 0 proves is entirely commercial: that a local business will buy the hybrid package, that students can sell, that a school will sign. None of that needs software, and all of it can fail — which is the argument for finding out before cutting four models and two roles into a schema whose first loop is still being closed.

Stage 1 — the \$5 models, the two roles, the `/s/[code]` namespace, the student and advisor portals — is earned once an edition has sold. **Stage 2** — points, leaderboard, digital reader, self-service — follows the same rule.

11 · Roadmap slot

NEXT is a **Block C**, after B8. Not a milestone inside Block B, and not interleaved with one.

C1 · SponsorX NEXT — publication, students, splits

Publication / **Edition** / **AdSlot** with the inventory ledger and close-date enforcement. **Student** + **StudentState** reusing **Guardian**. **RevenueSplit** on the edition; **Earning** untouched. **StudentCode** + **SaleAttribution** at `/s/[code]`. **STUDENT** and **ADVISOR** in `authz-policy.ts` with isolation tests. Student portal (mobile-first) and advisor desk. **P3-BE-12** amended to evaluate the margin floor against NIL line items rather than package totals.

Exit: a school is a Property, an edition sells a back cover exactly once, a student's code attributes a sale, artwork clears the approval board, the sponsor report carries print circulation as **ESTIMATED**, and the split resolves to four payees without touching **Earning**. (L)

The guardrail stands: if time runs short, cut from here — never from §39.

12 · What this does not decide

- **Magazine copy sales.** \$10 × 500 copies is taking money from parents. The Phase 1 payment policy is invoice and reference tracking only, with the payment adapter deferred to Phase 2. Either the school collects and the platform records units, or this waits. **Unresolved.**
- **Cash and scholarships to minors** — the \$1,000 top-seller prize and the 25% student pool. This is the legal review §26 and §37 already gate on, and it blocks Stage 1, not Stage 0.
- **The Sales Challenge as a contest.** Prizes awarded on a sales ranking is sweepstakes-adjacent, and §37 already requires reward terms reviewed before the sponsor pilot.
- **The split percentages.** 35/25/25/15 is the source document's illustration, explicitly adjustable. It needs a commercial decision of the kind **P0-PM0-13** was for pricing.
- **Whether the advisor or BTG holds final editorial approval** on student content that names a sponsor.
- **The fifth portal accent** (§9.1).

- **Whether an ad-only sale is a Campaign at all** (§5.2). A campaign with no athletes has no orders and no one to staff. Skipping it to **APPROVAL** is the small fix; attaching ad sales to the **Edition** instead is the honest one.
- **Whether Publication belongs to a Property or stands alone** for the regional DMV edition. Probably nullable **propertyId**; not yet argued.

*References: Blueprint §5, §6, §7, §11, §16, §18, §21, §26, §37, §39. Source: "SponsorX NEXT" concept document. Extends **P2-BE-02** (schema), **P0-PMO-13** (pricing and package line items), **P0-DATA-01** (provenance). Amends **P3-BE-12** (margin floor scope). Gated by `P0-LEG-` (minors, rewards) and the Phase 1 payment policy.**
